Education

- Expected May 2028** **Ph.D. in Electrical Engineering (Medical Imaging & AI)**, *Georgia Institute of Technology*
Graduate GPA: 3.9/4.0
Research focus: machine learning and representation learning methods for medical imaging analysis, with experience in large-scale brain MRI datasets and diverse downstream tasks including tumor segmentation, survival prediction, neurological disease diagnosis, and cross-cohort generalization.
Course project (ECE 8803, Conversational AI): reproduced TIGER for generative recommendation — an RQ-VAE building Semantic IDs over 715,729 Sentence-T5 item embeddings, on a PySpark pipeline over 59.77M Amazon reviews.
- May 2023** **B.S. in Electrical Engineering (2nd Major: Computer Science)**, *University of Wisconsin–Madison*
Cumulative GPA: 3.7/4.0 | EE Major GPA: 3.9/4.0
Dean's List.

Technical Skills

- Programming** Python, C/C++, MATLAB, SQL
- Deep Learning** PyTorch, TensorFlow; Vision Transformers (ViT), convolutional neural networks (CNN); self-supervised learning, contrastive learning, masked modeling, self-distillation, transfer learning; residual vector quantization (RQ-VAE), straight-through estimation, sequential recommendation, generative retrieval

Evaluation & Analysis	representation evaluation (CKA), embedding visualization (t-SNE), robustness analysis, statistical validation
Medical Imaging	multimodal medical imaging analysis, survival modeling (Cox regression), cross-domain transfer
Systems & Data	Linux/Unix, Git, Docker, reproducible ML pipelines; PySpark (partition/shuffle tuning, join strategy, physical-plan inspection), Parquet

Research Experience

BrainDINO: Self-supervised Foundation Model for Brain MRI	<i>Aug 2025 – Present</i>
- Developed a large-scale self-supervised representation learning framework for brain MRI, pretraining on ~6.6M unlabeled 2D axial slices (52k+ volumes × 128 slices) from 20 heterogeneous public neuroimaging datasets. - Designed a DINO-style teacher–student training strategy for slice-wise MRI representation learning with strict subject-level separation to study robustness under cross-dataset distribution shift. - Evaluated representation transfer using frozen-backbone adaptation under limited-label regimes (10–100% supervision), across tumor segmentation, disease classification, brain age regression, survival prediction, and molecular mutation prediction. - Released a public GitHub repository with organized downstream evaluation code and reproducible task-level entry points. <i>Outcome: First-author arXiv preprint; journal submission under review; code: GitHub.</i>	

Anticipatory Digital Twins for Adaptive Proton Therapy	<i>2026</i>
Predicted treatment-day anatomy before image acquisition by transferring longitudinal change across a patient population, using a pretrained foundation-model registration network with no patient-specific training; across 88 head-and-neck cases, synthesized CTs improved image similarity (NCC) by 22.8% and organ-at-risk Dice by 20.2%, and reduced CT-number error by 23.4% over the planning CT.	

MedDINOv3: Domain-adaptive Vision Foundation Model	<i>Jun 2025 – Oct 2025</i>
Adapted the DINOv3 self-distillation framework with multi-scale token aggregation for dense medical segmentation; evaluated cross-modality CT/MRI transfer using the CT-3M dataset (3.8M+ slices, 16 datasets).	

Brain Metastases Detection and Segmentation	<i>Dec 2024 – May 2025</i>
Developed a 3D deformable convolutional neural network for detecting and segmenting small brain metastases on MRI, improving robustness to scale variation and sparse lesion distribution.	

Reconstruction-guided Self-supervised Segmentation (AnatoMask)	<i>Nov 2023 – May 2024</i>
Proposed reconstruction-guided self-masking to improve robustness and generalization under limited-label supervision.	

Industry Experience

MRI Scout-based Anatomical Detection for Safety-Critical Systems	<i>May 2024 – Aug 2024, GE Healthcare</i>
<i>MR Application / PSD Development Engineer Intern</i>	

Developed safety-critical 3D computer vision models for robust anatomical detection under partial observability and truncated fields of view; queried internal clinical imaging databases using **SQL** to identify and retrieve MRI cohorts for model development and validation; 3D MRI SAR GradWarp correction for reconstruction; system-level implementation in **C++**; built end-to-end data pipelines including data collection, labeling, training, evaluation, and deployment; containerized deployment using **Docker** with reproducible ML workflows under strict reliability constraints.
Outcome: Deployed as an internal safety modeling component at GE Healthcare.

Professional Service & Teaching

Reviewer	<i>IEEE Transactions on Medical Imaging (2025); MICCAI (2025); Medical Physics (2026)</i>
Teaching	Undergraduate Teaching Assistant, University of Wisconsin–Madison (2022–2023): ECE 532 Matrix Methods in Machine Learning; ECE 252 Introduction to Computer Engineering.
